**A. Document Revision History for Intel FPGA SDK for OpenCL Standard Edition
Getting Started Guide 36**

1. Intel® FPGA SDK for OpenCL™ Standard Edition Getting Started Guide

The *Intel® FPGA SDK for OpenCL™ Standard Edition Getting Started Guide* describes the procedures to install the Intel FPGA Software Development Kit (SDK) for OpenCL⁽¹⁾ Standard Edition. This document also contains instructions on how to compile an example OpenCL⁽²⁾ application with the Intel FPGA SDK for OpenCL Standard Edition.

OpenCL is a C-based open standard for the parallel programming of heterogeneous devices. For more information about the OpenCL Specification version 1.0, refer to the [OpenCL 1.0 Reference Pages](#). For detailed information on the OpenCL application programming interface (API) and programming language, refer to the [OpenCL Specification version 1.0](#).

The Intel FPGA SDK for OpenCL Standard Edition provides a compiler and tools for you to build and run OpenCL applications that target Intel FPGA products. The Intel FPGA SDK for OpenCL Standard Edition supports the embedded profile of the OpenCL Specification version 1.0.

- Attention:**
- If you only require the Intel FPGA SDK for OpenCL's kernel deployment functionality, download and install the Intel FPGA Runtime Environment (RTE) for OpenCL. Refer to the *Intel FPGA RTE for OpenCL Standard Edition Getting Started Guide* for more information.

Do not install the SDK and the RTE on the same host system. The SDK already contains the RTE.
 - If you want to use the Intel FPGA SDK for OpenCL Standard Edition with the Cyclone® V SoC Development Kit, refer to the *Intel FPGA SDK for OpenCL Standard Edition Cyclone V SoC Getting Started Guide* for more information.

Related Information

- [OpenCL Reference Pages](#)
- [OpenCL Specification version 1.0](#)
- [Intel FPGA RTE for OpenCL Standard Edition Getting Started Guide](#)
- [Intel FPGA SDK for OpenCL Standard Edition Cyclone V SoC Getting Started Guide](#)

(1) The Intel FPGA SDK for OpenCL is based on a published Khronos Specification, and has passed the Khronos Conformance Testing Process. Current conformance status can be found at www.khronos.org/conformance.

(2) OpenCL and the OpenCL logo are trademarks of Apple Inc. used by permission of the Khronos Group™.

1.1. Prerequisites for the Intel FPGA SDK for OpenCL Standard Edition

To install the Intel FPGA SDK for OpenCL Standard Edition and create an OpenCL application for an Intel FPGA Preferred Board for OpenCL, your system must meet certain hardware, target platform, and software requirements.

Hardware Requirements

Accelerator boards requirements:

- Acquire a Reference Platform from Intel, or a Custom Platform from an Intel preferred board vendor.

For more information, refer to the [Intel FPGA SDK for OpenCL FPGA Platforms](#) page on the Intel FPGA website.

Development system requirements:

- You must have administrator, root, or sudo privileges on the development system to install the necessary packages and drivers.
- The development system has at least 85 gigabytes (GB) of free disk space for software installation.
- The development system has at least 24 GB of RAM.

Tip: Refer to board vendor's documentation on the recommended system storage size.

- For PCI Express* (PCIe*) accelerator boards, the host machine motherboard must have an available PCIe port slot that is at least the same width (that is, the same number of PCIe lanes) as the board.

The host system must be running one of the following supported operating systems:

- For a list of supported Windows and Linux operating systems, refer to the [Operating System Support](#) page on the Intel FPGA website.

Software Prerequisites

Develop your host application using one of the following Intel FPGA SDK for OpenCL- and Intel Quartus® Prime software-compatible C compiler or software development environment:

- For Windows systems, use Microsoft Visual Studio Professional version 2010 or later.
- For Linux systems, use the C compiler included with the GCC.

Linux systems require the Perl command version 5 or later. Include the path to the Perl command in your *PATH* system environment variable setting.

For Intel FPGA SDK for OpenCL packages that include Intel Code Builder, Intel Code Builder requires Java SE version 1.8.71 or later to run.

Related Information

Intel FPGA SDK for OpenCL FPGA Platforms

1.2. Contents of the Intel FPGA SDK for OpenCL Standard Edition

The Intel FPGA SDK for OpenCL Standard Edition provides programs, drivers, and SDK-specific libraries and files.

Logic Components

- The *Intel FPGA SDK for OpenCL Offline Compiler* translates your OpenCL device code into a hardware configuration file that the system loads onto an Intel FPGA product.
- The *Intel FPGA SDK for OpenCL Standard Edition* utility includes a set of commands you can invoke to perform high-level tasks such as running diagnostic tests.
- The *host runtime* provides the OpenCL host and runtime API for your OpenCL host application.

The host runtime consists of libraries that provide OpenCL APIs, hardware abstractions, and helper libraries.

Drivers, Libraries and Files

The software installation process installs the Intel FPGA SDK for OpenCL Standard Edition into a directory that you own. The `INTELFPGAOCSDKROOT` environment variable references the path to the SDK's installation directory.

Table 1. Select Contents of the Intel FPGA SDK for OpenCL Standard Edition Installation Directory

Windows Folder	Linux Directory	Description
bin	bin	User commands in the SDK. Include this directory in your <code>PATH</code> environment variable setting.
board	board	The Intel FPGA SDK for OpenCL Standard Edition Custom Platform Toolkit and Reference Platforms available with the software. <ul style="list-style-type: none"> • The path to the Custom Platform Toolkit is <code>INTELFPGAOCSDKROOT/board/custom_platform_toolkit</code> • The path to the s5_ref Reference Platform is <code>INTELFPGAOCSDKROOT/board/s5_ref</code>
ip	ip	Intellectual property (IP) cores used to compile device kernels.
host	host	Files necessary for compiling and running your host application.
host\include	host/include	OpenCL Specification version 1.0 header files and software interface files necessary for compiling and linking your host application. The <code>host/include/CL</code> subdirectory also includes the C++ header file <code>cl.hpp</code> . The file contains an OpenCL version 1.1 C++ wrapper API. These C++ bindings enable a C++ host program to access the OpenCL runtime APIs using native C++ classes and methods. <i>Important:</i> The OpenCL version 1.1 C++ bindings are compatible with OpenCL Specification versions 1.0 and 1.1. Add this path to the <code>include</code> file search path in your development environment.
host \windows64\lib	host/ linux64/lib	OpenCL host runtime libraries that provide the OpenCL platform and runtime APIs. These libraries are necessary for linking your host application.

continued...

Windows Folder	Linux Directory	Description
		To run an OpenCL application on Linux, include this directory in the <code>LD_LIBRARY_PATH</code> environment variable setting.
host \windows64\bin	host/ linux64/bin	Runtime commands and libraries necessary for running your host application, wherever applicable. For 64-bit Windows system, include this directory in your <code>PATH</code> environment variable setting. For Windows system, this folder contains runtime libraries. For Linux system, this directory contains platform-specific binary for the <code>aocl</code> utility command.
share	share	Architecture-independent support files.

Example OpenCL Applications

You can download example OpenCL applications from the OpenCL Design Examples page.

[OpenCL Design Examples](#)

1.3. Overview of the Intel FPGA SDK for OpenCL Standard Edition Setup Process

The *Intel FPGA SDK for OpenCL Standard Edition Getting Started Guide* outlines the procedures for installing the Intel FPGA SDK for OpenCL Standard Edition and programming your FPGA.

The figure below summarizes the steps for setting up the necessary software and installing the FPGA board.

Figure 1. Intel FPGA SDK for OpenCL Standard Edition Installation Process Overview

Attention: For possible errors after implementing `aocl diagnose` utility, refer to [Possible Errors After Running the `diagnose` Utility](#) section.

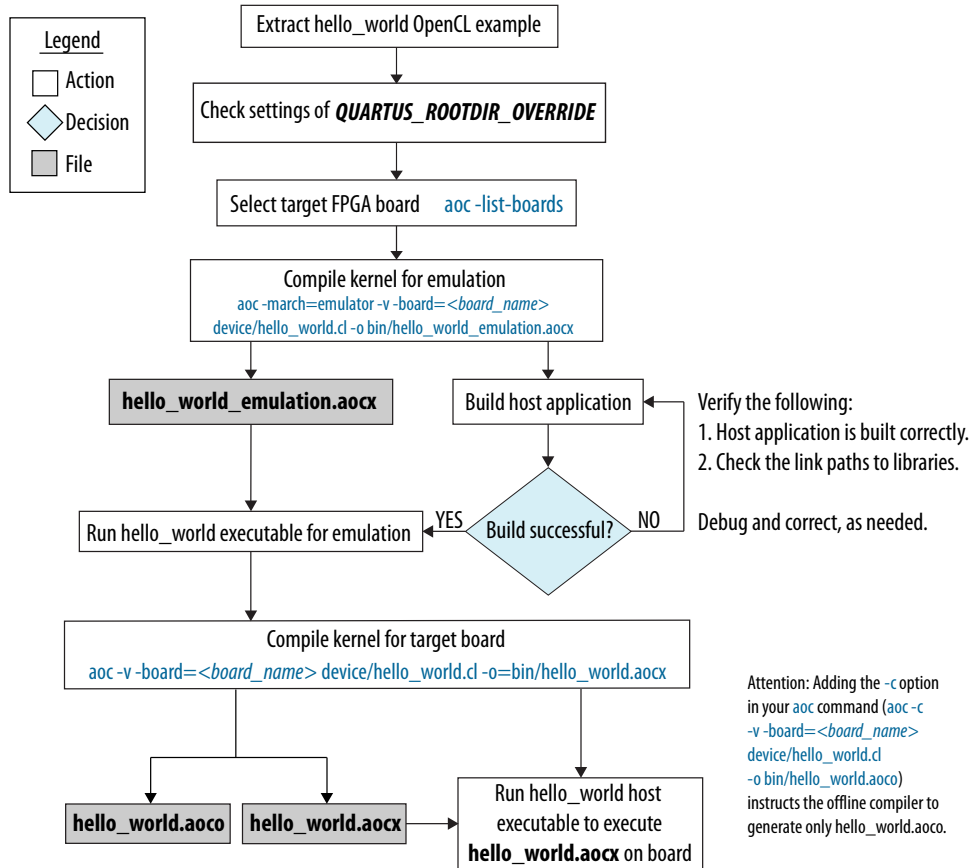

After you complete the initial software and hardware setup successfully, you can create a hardware image from the `hello_world` OpenCL design example.

Attention: Before you program your FPGA with the hardware image, ensure that your FPGA contains an image created using a current version of the Intel FPGA SDK for OpenCL. Refer to [Updating the Hardware Image on the FPGA](#) for more information

The figure below summarizes the steps you perform to program your FPGA.

Figure 2. FPGA Programming Overview

Related Information

Updating the Hardware Image on the FPGA on page 19

2. Getting Started with the Intel FPGA SDK for OpenCL Standard Edition for Windows

The Intel FPGA SDK for OpenCL Standard Edition setup process includes downloading and installing the software, installing the FPGA board, and then executing an OpenCL kernel on the FPGA.

1. [Downloading the Intel FPGA SDK for OpenCL Standard Edition](#) on page 10
2. [Installing the Intel FPGA SDK for OpenCL](#) on page 11
3. [Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables](#) on page 11
4. [Verifying Software Installation](#) on page 12
5. [Installing an FPGA Board](#) on page 13
6. [Verifying Host Runtime Functionality via Emulation](#) on page 14
7. [Creating the FPGA Hardware Configuration File of an OpenCL Kernel](#) on page 17
8. [Updating the Hardware Image on the FPGA](#) on page 19
9. [Executing an OpenCL Kernel on an FPGA](#) on page 21
10. [Uninstalling the Software](#) on page 22
11. [Uninstalling the FPGA Board](#) on page 23

2.1. Downloading the Intel FPGA SDK for OpenCL Standard Edition

Download the installation package that contains the Intel FPGA SDK for OpenCL Standard Edition and all related software for Windows from the Intel FPGA SDK for OpenCL Download Center.

The Intel FPGA SDK for OpenCL Download Center provides a tar file that includes all of the following software and files:

- Intel FPGA SDK for OpenCL Standard Edition
 - Intel Quartus Prime Standard Edition software
 - Device support
1. Go to the Intel FPGA SDK for OpenCL Download Center at the following URL:
<http://fpgasoftware.intel.com/openccl/>
 2. Select the Standard edition.
 3. Select the software version. The default selection is the current version.
 4. Select one of the following download methods:
 - **Akamai DLM3 Download Manager**
 - **Direct Download**

5. Click the **Windows SDK** tab.
6. Click **More** beside **Download and install instructions** if you want to see the download and installation instructions.
7. Click the download button to start the download process.
8. Perform the steps outlined in the download and installation instructions on the download page.

Related Information

[Intel FPGA website](#)

2.2. Installing the Intel FPGA SDK for OpenCL

In this section, you learn how to unpack the downloaded tar archive and run the installation files to install all the software and files. Install the Windows version of the Intel FPGA SDK for OpenCL Standard Edition in a folder that you own.

You must have administrator privileges to execute these instructions.

To install the Intel FPGA SDK for OpenCL, Intel Quartus Prime Standard Edition software, and device support files, perform the following tasks:

1. Unpack the downloaded `AOCL-<version>-<build>-windows.tar` archive into a temporary folder.
2. Run the `setup.bat` file to install the SDK with the Intel Quartus Prime Standard Edition software.
3. *Note:* The installer sets the user environment variable `INTELFPGAOCSDKROOT` to point to the path of the software installation.

Verify that `INTELFPGAOCSDKROOT` points to the current version of the software. Open a Windows command window and then type `echo %INTELFPGAOCSDKROOT%` at the command prompt.

If the returned path does not point to the location of the Intel FPGA SDK for OpenCL installation, edit the `INTELFPGAOCSDKROOT` setting.

Related Information

[Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables](#) on page 11

2.3. Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables

You have the option to set the Intel FPGA SDK for OpenCL Standard Edition Windows user environment variables permanently or transiently. The environment variable settings describe the FPGA board and the host runtime to the software.

Attention: If you set the environment variables permanently, you apply the settings once during installation. If you set the environment variables transiently, you must apply the settings during installation and during every subsequent session you run.

**Table 2. Intel FPGA SDK for OpenCL Windows User Environment Variable Settings**

Environment Variable	Path to Include
PATH	1. %INTELFPGAOCSDKROOT%\bin 2. %INTELFPGAOCSDKROOT%\windows64\bin 3. %INTELFPGAOCSDKROOT%\host\windows64\bin where <i>INTELFPGAOCSDKROOT</i> points to the path of the software installation

- To apply permanent environment variable settings, perform the following tasks:
 - a. Click **Windows Start menu > Control Panel** (or search for and then open the Control Panel application in Windows 8.1 and Windows 10).
 - b. Click **System and Security > System**.
 - c. In the **System** window, click **Advanced system settings**.
 - d. Click the **Advanced** tab in the **System Properties** dialog box.
 - e. Click **Environment Variables**.
The **Environment Variables** dialog box appears.
 - f. To modify an existing environment variable setting, select the variable under **User variables for <user_name>** and then click **Edit**. In the **Edit User Variable** dialog box, type the environment variable setting in the **Variable value** field.
 - g. If you add a new environment variable, click **New** under **User variables for <user_name>**. In the **New User Variable** dialog box, type the environment variable name and setting in the **Variable name** and **Variable value** fields, respectively.

For an environment variable with multiple settings, add semicolons to separate the settings.

- To apply transient environment variable settings, open a command window and run the %INTELFPGAOCSDKROOT%\init_opencl.bat script.

Example script output:

```
Adding %INTELFPGAOCSDKROOT%\bin to PATH
Adding %INTELFPGAOCSDKROOT%\host\windows64\bin to PATH
```

Running the `init_opencl.bat` script only affects the current command window. The script performs the following tasks:

- Finds the Intel Quartus Prime Standard Edition software installation
- Finds the Microsoft Visual Studio installation
- Imports the Microsoft Visual Studio environment to properly set the *LIB* environment variable
- Ensures that the *PATH* environment variable includes the path to the Microsoft `LINK.EXE` file and the `aoc.exe` file

2.4. Verifying Software Installation

Invoke the `version` utility command and verify that the correct version of the OpenCL software is installed.

- At a command prompt, invoke the `aocl version` utility command. An output similar to the one below notifies you of a successful installation:

```
aocl <version>.<build> (Intel(R) FPGA SDK for OpenCL(TM), Version <version>  
Build <build>, Copyright (C) <year> Intel Corporation)
```

- If installation was unsuccessful, reinstall the software. You can also refer to the *Intel FPGA Software Installation and Licensing* manual and the Intel FPGA Knowledge Base for more information.

Related Information

- [Intel FPGA Software Installation and Licensing](#)
- [Intel FPGA Knowledge Base](#)

2.5. Installing an FPGA Board

Before creating an OpenCL application for an FPGA board, you must first download and install the Custom Platform from your board vendor. Most Custom Platform installers require administrator privileges. To install your board into a Windows host system, invoke the `install <path_to_customplatform>` utility command.

The steps below outline the board installation procedure. Some Custom Platforms require additional installation tasks. Consult your board vendor's documentation for further information on board installation.

1. Follow your board vendor's instructions to connect the FPGA board to your system.
2. Download the Custom Platform for your FPGA board from your board vendor's website. To download an Intel FPGA SDK for OpenCL Reference Platform, refer to the Intel FPGA SDK for OpenCL FPGA Platforms page.
3. Install the Custom Platform in a folder that you own (that is, not a system folder).

You can install multiple Custom Platforms simultaneously on the same system using the SDK utilities, such as `aocl diagnose` with multiple Custom Platforms. The Custom Platform subdirectory contains the `board_env.xml` file.

In a system with multiple Custom Platforms, ensure that the host program uses the FPGA Client Driver (FCD) to discover the boards rather than linking to the Custom Platforms' memory-mapped device (MMD) libraries directly. As long as FCD is correctly set up for Custom Platform, FCD finds all the installed boards at runtime.

4. Set the `QUARTUS_ROOTDIR_OVERRIDE` user environment variable to point to e installation directory.
5. Add the paths to the Custom Platform libraries (for example, the memory-mapped (MMD) library) to the `PATH` environment variable setting.

For information on setting user environment variables and running the `init_openc1` script, refer to the *Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables* section.

6. Invoke the command `aocl install <path_to_customplatform>` at a command prompt.

Invoking `aocl install <path_to_customplatform>` also installs a board driver that allows communication between host applications and hardware kernel programs.

Remember: You need administrative rights to install a board. To run a Windows command prompt as an administrator, click **Start > All Programs > Accessories**. Under **Accessories**, right click **Command Prompt**. In the right-click menu, click **Run as Administrator**.

7. To query a list of FPGA devices installed in your machine, invoke the `aocl diagnose` command.
The software generates an output that includes the `<device_name>`, which is an acl number that ranges from `acl0` to `acl31`.

Attention: For more information on querying the `<device_name>` of your accelerator board, refer to the *Querying the Device Name of Your FPGA Board* section.

8. To verify the successful installation of the FPGA board, invoke the command `aocl diagnose <device_name>` to run any board vendor-recommended diagnostic test.

Related Information

- [Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables](#) on page 11
- [Querying the Device Name of Your FPGA Board](#) on page 19
- [Installing the Cyclone V SoC Development Kit](#)
- [Intel FPGA SDK for OpenCL FPGA Platforms](#)

2.6. Verifying Host Runtime Functionality via Emulation

Test the functionality of the host runtime by emulating an OpenCL design example using the Intel FPGA SDK for OpenCL Standard Edition Emulator.

1. Install a Custom or Reference Platform because emulation targets a specific FPGA board.
2. Verify that the `QUARTUS_ROOTDIR_OVERRIDE` environment variable points to the correct edition of the Intel Quartus Prime Standard Edition software. Open a Windows command window and then type `echo %QUARTUS_ROOTDIR_OVERRIDE%` at the command prompt.

If the path to the installation folder of the Intel Quartus Prime Standard Edition software is not returned, add it to the `QUARTUS_ROOTDIR_OVERRIDE` setting.

3. Add the path to the `LINK.exe` file in Microsoft Visual Studio to the `PATH` user environment variable setting.
4. Add the path to the Microsoft compilation time libraries in Microsoft Visual Studio to the `LIB` user environment variable setting.

[Downloading an OpenCL Design Example](#) on page 15

[Compiling a Kernel for Emulation](#) on page 15

[Building the Host Application](#) on page 15

[Emulating Your OpenCL Kernel](#) on page 16

2.6.1. Downloading an OpenCL Design Example

The OpenCL Design Examples page contains sample applications of varying complexities that you can download and run on your FPGA.

The following instructions are for downloading the Hello World design.

1. In the OpenCL Design Examples page, under Basic Examples, click **Hello World**.
2. In the Hello World Design Example page, under Downloads, click **<version> x64 Windows package (.zip)** to download the compressed file for your platform.
3. Unzip the `exm_openc1_hello_world_x64_windows_<version>.zip` file and save it in a folder that you have write access for.

Important: Ensure that the folder name does not contain spaces.

Related Information

[OpenCL Design Examples](#)

2.6.2. Compiling a Kernel for Emulation

To compile an OpenCL kernel for emulation, include the `-march=emulator` option in your `aoc` command.

- To compile the kernel for your target FPGA board, at a command prompt, navigate to the `hello_world` design and then invoke the following command:

```
aoc -march=emulator -v -board=<board_name> device/  
hello_world.cl -o=bin/hello_world_emulation.aocx
```

The Intel FPGA SDK for OpenCL Offline Compiler compiles the `hello_world.cl` kernel source file and creates the `hello_world_emulation.aocx` emulation-specific executable file in the `bin` subdirectory.

2.6.3. Building the Host Application

The `<path_to_exm_openc1_hello_world_x64_windows_<version>>\hello_world\hello_world.sln` file contains the host solution. After you open this `.sln` file in Microsoft Visual Studio, you can build the OpenCL host application in the `main.cpp` file.

If you are using Microsoft Visual Studio, you need the FCD, and the Installable Client Driver (ICD) from Khronos. To set up Microsoft Visual Studio with FCD and ICD, perform the following tasks prior to building the host application:

1. Verify that FCD and ICD are set up correctly. You must set up FCD and ICD manually if invoking the `aocl install <path_to_customplatform>` utility command fails to set them up. For instructions, refer to the *Accessing Custom Platform-Specific Functions* and *Linking to the ICD Loader Library on Windows* sections of the *Intel FPGA SDK for OpenCL Standard Edition Programming Guide* for more information.
2. Link the host application to the `OpenCL.lib` library.

- a. Under the solution properties, select **Configuration Properties > Linker > Input**.
- b. In the **Additional Dependencies** field, enter `OpenCL.lib`.

Attention: Because you are using FCD and ICD, do not link the host program to `alteracl.lib` or to your Custom Platform's MMD libraries directly.

To build the `hello_world` host application, perform the following tasks:

1. Open the `<path_to_exm_opencl_hello_world_x64_windows_<version>>\hello_world\hello_world.sln` file in Microsoft Visual Studio.
2. Verify that the build configuration is correct. The default build configuration is **Debug**, but you can use **Release**. You must select the appropriate option as the solution platform (for example, for x64 architecture, select **x64**).
3. Build the solution by selecting the **Build > Build Solution** menu option, or by pressing the F7 key.
The `hello_world.exe` executable will be in the `<path_to_exm_opencl_hello_world_x64_windows_<version>>\hello_world\bin` folder.
4. Verify that the build is correct. An output ending with a message similar to the one shown below notifies you of a successful build:

```
1> Build succeeded.
1>
1> Time Elapsed 00:00:03:29
===== Build: 1 succeeded, 0 failed, 0 up-to-date, 0 skipped =====
```

Attention: You can ignore the `LNK4009: PDB 'vc90.pdb' was not found with...` warnings because they have no effect on the build. The compiler might issue this type of warning messages if you have built your Windows libraries using a previous version of Microsoft Visual Studio.

Related Information

- [Accessing Custom Platform-Specific Functions](#)
- [Linking to the ICD Loader Library on Windows](#)

2.6.4. Emulating Your OpenCL Kernel

To emulate your OpenCL kernel, run the emulation `.aocx` file on the platform on which you build your kernel.

To emulate your kernel, perform the following steps:

1. Run the utility command `aocl linkflags` to find out which libraries are necessary for building a host application. The software lists the libraries for both emulation and regular kernel compilation flows.
2. Link your host application to the libraries returned by the `aocl linkflags` utility command.
3. Move the `hello_world_emulation.aocx` file to the current working directory so that the host can locate it easily.
4. To run the host application for emulation, first define the number of emulated devices by invoking the `set`
`CL_CONTEXT_EMULATOR_DEVICE_INTELFPGA=<number_of_devices>`
command and then run the host application.
This command specifies the number of identical emulation devices that the Emulator needs to provide.
Remember: When the environment variable `CL_CONTEXT_EMULATOR_DEVICE_INTELFPGA` is set, only the emulated devices are available, that is, access to all physical boards is disabled.
5. After you run the host application, unset the `CL_CONTEXT_EMULATOR_DEVICE_INTELFPGA` variable by invoking the `set`
`CL_CONTEXT_EMULATOR_DEVICE_INTELFPGA=` command.

Each invocation of the emulated kernel creates a shared library copy called `<process_ID>-libkernel.so` in a default temporary directory, where `<process_ID>` is a unique numerical value assigned to each emulation run. You may override the default directory by setting the `TMP` or `TEMP` environment variable.

Related Information

[Running the Host Application](#) on page 21

2.7. Creating the FPGA Hardware Configuration File of an OpenCL Kernel

Download the Windows version of the `hello_world` OpenCL design example from the OpenCL Design Examples page. Compile the `hello_world` kernel program using the Intel FPGA SDK for OpenCL Offline Compiler to create the `hello_world.aocx` executable file. The `.aocx` file is the FPGA hardware configuration file.

After you successfully install your FPGA board and emulate your kernel, you can create a `.aocx` file that executes on the device. The steps below describe the process of creating a `.aocx` file from the `hello_world` example design. For more information on the OpenCL design examples, refer to the OpenCL Design Examples page.

Note: The Intel FPGA SDK for OpenCL Offline Compiler compiles an OpenCL kernel for a target FPGA board. You must install the FPGA board before creating a hardware configuration file. If you have not installed the FPGA board, refer to *Installing an FPGA Board* for more instructions.

1. Verify that the `QUARTUS_ROOTDIR_OVERRIDE` environment variable points to the Intel Quartus Prime Standard Edition software. Open a Windows command window and then type `echo %QUARTUS_ROOTDIR_OVERRIDE%` at the command prompt.
If the path to the installation folder of the Intel Quartus Prime Standard Edition software is not returned, add it to the `QUARTUS_ROOTDIR_OVERRIDE` setting.
2. Select your target FPGA board. To list the FPGA boards available in your Custom Platform, invoke the command `aoc -list-boards` at a command prompt.
For more information on the `-list-boards` option of the `aoc` command, refer to the *Listing the Available FPGA Boards in Your Custom Platform (-list-boards)* section of the *Intel FPGA SDK for OpenCL Standard Edition Programming Guide*.
3. At a command prompt, navigate to the `hello_world` design folder containing the `hello_world.cl` file that you used for emulation.
4. To compile the kernel for your target FPGA board, invoke the following command:
`aoc -v -board=<board_name> device/hello_world.cl -o=bin/hello_world.aocx`

This command performs the following tasks:

- Generates the Intel Quartus Prime design project files from the OpenCL source code.
- Checks for initial syntax errors.
- Performs basic optimizations.
- Creates a `hello_world` folder containing necessary intermediate files.
- Creates the *Intel FPGA SDK for OpenCL Offline Compiler Object File* (`.aoco`).
- Creates the `.aocx` file.

Attention: The `.aocx` file might take hours to build, depending on the complexity of the kernel. To view the progress of the compilation on-screen, include the `-v` flag in your `aoc` command. An example output is shown below.

```
aoc: Environment checks are completed successfully.
You are now compiling the full flow!!
aoc: Selected target board <board_name>
aoc: Running OpenCL parser....
aoc: OpenCL parser completed successfully.
aoc: Compiling....
aoc: Linking with IP library ...
aoc: First stage compilation completed successfully.
aoc: Setting up project for CvP revision flow....
aoc: Hardware generation completed successfully.
```

The offline compiler displays the line `aoc: Hardware generation completed successfully.` to signify the completion of the compilation process.

For more information about the `-board <board_name>` option of the `aoc` command, refer to the *Compiling a Kernel for a Specific FPGA Board (-board=<board_name>)* section of the *Intel FPGA SDK for OpenCL Standard Edition Programming Guide*.

For more information about the `-v` option of the `aoc` command, refer to the *Generating Compilation Progress Report (-v)* section of the *Intel FPGA SDK for OpenCL Standard Edition Programming Guide*.

For more information about the `-o=<filename>` option of the `aoc` command, refer to the *Specifying the Name of an Intel FPGA SDK for OpenCL Offline Compiler Output File (-o <filename>)* section of the *Intel FPGA SDK for OpenCL Standard Edition Programming Guide*.

- [Specifying the Name of an Intel FPGA SDK for OpenCL Offline Compiler Output File \(-o=<filename>\)](#)
- [OpenCL Design Examples](#)
- [Installing an FPGA Board](#) on page 13
- [Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables](#) on page 11

2.8. Updating the Hardware Image on the FPGA

If applicable, before you execute an OpenCL kernel program on the FPGA, ensure that the flash memory of the FPGA contains a hardware image created using a current version of the OpenCL software.

- Remember:*
- If your Custom Platform requires that you preload a valid OpenCL image into the flash memory, for every major release of the Intel Quartus Prime Design Suite, program the flash memory of the FPGA with a hardware image compatible with the current version of the software.

2.8.1. Querying the Device Name of Your FPGA Board

Some OpenCL software utility commands require you to specify the device name (`<device_name>`). The `<device_name>` refers to the acl number (e.g. `acl0` to `acl31`) that corresponds to the FPGA device. When you query a list of accelerator boards, the OpenCL software produces a list of installed devices on your machine in the order of their device names.

- To query a list of installed devices on your machine, type `aocl diagnose` at a command prompt. The software generates an output that resembles the example shown below:

```
aocl diagnose: Running diagnostic from INTELFPGAOCLESDKROOT/board/  
<board_name>/<platform>/libexec  
  
Verified that the kernel mode driver is installed on the host machine.  
  
Using board package from vendor: <board_vendor_name>  
Querying information for all supported devices that are installed on the  
host machine ...  
  
device_name  Status  Information
```

```
acl0      Passed <descriptive_board_name>
           PCIe dev_id = <device_ID>, bus:slot.func = 02:00.00,
           at Gen 2 with 8 lanes.
           FPGA temperature = 43.0 degrees C.

acl1      Passed <descriptive_board_name>
           PCIe dev_id = <device_ID>, bus:slot.func = 03:00.00,
           at Gen 2 with 8 lanes.
           FPGA temperature = 35.0 degrees C.

Found 2 active device(s) installed on the host machine, to perform a full
diagnostic on a specific device, please run aocl diagnose <device_name>

DIAGNOSTIC_PASSED
```

2.8.2. Programming the Flash Memory of an FPGA

Configure the FPGA by loading the hardware image of an Intel FPGA SDK for OpenCL design example into the flash memory of the device. When there is no power, the FPGA retains the hardware configuration file in the flash memory. When you power up the system, it configures the FPGA circuitry based on this hardware image in the flash memory. Therefore, it is imperative that an OpenCL-compatible hardware configuration file is loaded into the flash memory of your FPGA.

Preloading an OpenCL image into the flash memory is necessary for the proper functioning of many Custom Platforms. For example, most PCIe-based boards require a valid OpenCL image in flash memory so that hardware on the board can use the image to configure the FPGA device when the host system powers up for the first time. If the FPGA is not configured with a valid OpenCL image, the system will fail to enumerate the PCIe endpoint, or the driver will not function.

Before running any designs, ensure that the flash memory of your board has a valid OpenCL image that is compatible with the current OpenCL software version. Consult your board vendor's documentation for board-specific requirements.

Caution: When you load the hardware configuration file into the flash memory of the FPGA, maintain system power for the entire loading process, which might take a few minutes. Also, do not launch any host code that calls OpenCL kernels or might otherwise communicate with the FPGA board.

To load your hardware configuration file into the flash memory of your FPGA board, perform the following tasks:

1. Install any drivers or utilities that your Custom Platform requires.

For example, some Custom Platforms require you to install the Intel FPGA Download Cable driver to load your hardware configuration file into the flash memory. For installation instructions, refer to the *Intel FPGA Download Cable User Guide*.

2. Download a design example for your Custom Platform.

Remember: Download design examples from the OpenCL Design Examples page, and extract the example to a location that you have write access for. Ensure that the location name does not contain spaces.

3. To load the hardware configuration file into the flash memory, invoke the `aocl flash <device_name> <design_example_filename>.aocx` command, where `<device_name>` refers to the acl number (e.g. acl0 to acl31) that

corresponds to your FPGA device, and `<design_example_filename>.aocx` is the hardware configuration file you create from the `<design_example_filename>.cl` file in the design example package.

4. Power down your device or computer and then power it up again.

Power cycling ensures that the FPGA configuration device retrieves the hardware configuration file from the flash memory and configures it into the FPGA.

Warning: Some Custom Platforms require you to power cycle the entire host system after programming the flash memory. For example, PCIe-based Custom Platforms might require a host system restart to reenumerate the PCIe endpoint. Intel recommends that you power cycle the complete host system after programming the flash memory.

2.9. Executing an OpenCL Kernel on an FPGA

Build your OpenCL host application in Microsoft Visual Studio, and run the application by invoking the `hello_world.exe` executable. The Intel FPGA SDK for OpenCL is compatible with 64-bit host binaries only.

Related Information

[Building the Host Application](#) on page 15

2.9.1. Running the Host Application

To execute the OpenCL kernel on the FPGA, run the Windows host application that you built from the `.sln` file.

1. Add the path `%INTELFPGAOCCLSDKROOT%\host\windows64\bin` to the `PATH` environment variable.
2. At a command prompt, navigate to the host executable within the `<path_to_exm_opencl_hello_world_x64_windows_<version>>\hello_world\bin` folder.
3. Invoke the `hello_world.exe` executable.
The `hello_world` executable executes the kernel code on the FPGA.

2.9.2. Output from Successful Kernel Execution

When you run the host application to execute your OpenCL kernel on the target FPGA, the OpenCL software notifies you of a successful kernel execution.

Example output:

```
Reprogramming device [0] with handle 1
Querying platform for info:
=====
CL_PLATFORM_NAME           = Intel(R) FPGA SDK for OpenCL(TM)
CL_PLATFORM_VENDOR        = Intel Corporation
```

```
CL_PLATFORM_VERSION = OpenCL 1.0 Intel(R) FPGA SDK for OpenCL(TM), <version>

Querying device for info:
=====
CL_DEVICE_NAME           = <board name> : <descriptive board
name>
CL_DEVICE_VENDOR         = <board vendor name>
CL_DEVICE_VENDOR_ID     = <board vendor ID>
CL_DEVICE_VERSION       = OpenCL 1.0 Intel(R) FPGA SDK for OpenCL(TM), <version>
CL_DRIVER_VERSION       = <version>
CL_DEVICE_ADDRESS_BITS  = 64
CL_DEVICE_AVAILABLE     = true
CL_DEVICE_ENDIAN_LITTLE = true
CL_DEVICE_GLOBAL_MEM_CACHE_SIZE = 32768
CL_DEVICE_GLOBAL_MEM_CACHELINE_SIZE = 0
CL_DEVICE_GLOBAL_MEM_SIZE = 8589934592
CL_DEVICE_IMAGE_SUPPORT = true
CL_DEVICE_LOCAL_MEM_SIZE = 16384
CL_DEVICE_MAX_CLOCK_FREQUENCY = 1000
CL_DEVICE_MAX_COMPUTE_UNITS = 1
CL_DEVICE_MAX_CONSTANT_ARGS = 8
CL_DEVICE_MAX_CONSTANT_BUFFER_SIZE = 2147483648
CL_DEVICE_MAX_WORK_ITEM_DIMENSIONS = 3
CL_DEVICE_MEM_BASE_ADDR_ALIGN = 8192

CL_DEVICE_PREFERRED_VECTOR_WIDTH_CHAR = 4
CL_DEVICE_PREFERRED_VECTOR_WIDTH_SHORT = 2
CL_DEVICE_PREFERRED_VECTOR_WIDTH_INT = 1
CL_DEVICE_PREFERRED_VECTOR_WIDTH_LONG = 1
CL_DEVICE_PREFERRED_VECTOR_WIDTH_FLOAT = 1
CL_DEVICE_PREFERRED_VECTOR_WIDTH_DOUBLE = 0
Command queue out of order? = false
Command queue profiling enabled? = true
Using AOCX: hello_world.aocx

Kernel initialization is complete.
Launching the kernel...

Thread #2: Hello from the Intel(R) FPGA OpenCL(TM) compiler!

Kernel execution is complete.
```

2.10. Uninstalling the Software

To uninstall the Intel FPGA SDK for OpenCL Standard Edition for Windows, run the uninstaller, and restore all modified environment variables to their previous settings.

1. From the Windows Start Menu shortcut, navigate to the Altera <version> Standard Edition installation folder.
2. Select **Uninstall Intel Quartus Prime Standard Edition**. The uninstallation wizard appears.
3. In the uninstallation wizard, perform the following tasks:
 - a. Select **Individual components** and then click **Next**.
 - b. Select the SDK and then click **Next**. The uninstaller uninstalls the Intel FPGA SDK for OpenCL.
4. Remove the following paths from the *PATH* environment variable:
 - a. %INTELFPGAOCXSDKROOT%\bin

- b. `%INTELFPGAOCLSDKROOT%\host\windows64\bin`
5. Remove the `INTELFPGAOCLSDKROOT` environment variable.
6. Remove the `QUARTUS_ROOTDIR_OVERRIDE` environment variable.

2.11. Uninstalling the FPGA Board

To uninstall an FPGA board for Windows, invoke the `uninstall` utility command, uninstall the Custom Platform, and unset the relevant environment variables. You must uninstall the existing FPGA board if you migrate your OpenCL application to another FPGA board that belongs to a different Custom Platform.

To uninstall your FPGA board, perform the following tasks:

1. Following your board vendor's instructions to disconnect the board from your machine.
2. Invoke the `aocl uninstall <path_to_customplatform>` utility command to remove the current host computer drivers (for example, PCIe drivers). The Intel FPGA SDK for OpenCL uses these drivers to communicate with the FPGA board.
3. Uninstall the Custom Platform.
4. Unset the `PATH` environment variable.

3. Getting Started with the Intel FPGA SDK for OpenCL Standard Edition for Linux

The Intel FPGA SDK for OpenCL Standard Edition setup process includes downloading and installing the software, installing the FPGA board, and then executing an OpenCL kernel on the FPGA.

1. [Downloading the Intel FPGA SDK for OpenCL Standard Edition](#) on page 24
2. [Installing the Intel FPGA SDK for OpenCL](#) on page 25
3. [Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables](#) on page 26
4. [Verifying Software Installation](#) on page 26
5. [Installing an FPGA Board](#) on page 27
6. [Verifying Host Runtime Functionality via Emulation](#) on page 28
7. [Creating the FPGA Hardware Configuration File of an OpenCL Kernel](#) on page 30
8. [Updating the Hardware Image on the FPGA](#) on page 32
9. [Executing an OpenCL Kernel on an FPGA](#) on page 34
10. [Uninstalling the Software](#) on page 35
11. [Uninstalling the FPGA Board](#) on page 35

3.1. Downloading the Intel FPGA SDK for OpenCL Standard Edition

Download the installation package that contains the Intel FPGA SDK for OpenCL Standard Edition and all related software for Linux from the Intel FPGA SDK for OpenCL Download Center.

The Download Center provides a tar file that includes all of the following software and files:

- Intel FPGA SDK for OpenCL Standard Edition
 - Intel Quartus Prime Standard Edition software
 - Device support
1. Go to the Intel FPGA SDK for OpenCL Download Center at the following URL:
<http://fpgasoftware.intel.com/opencl/>
 2. Select the Standard edition.
 3. Select the software version. The default selection is the current version.
 4. Select one of the following download methods:
 - **Akamai DLM3 Download Manager**
 - **Direct Download**

5. On the **Linux SDK** tab.
6. Click **More** beside **Download and install instructions** if you want to see the download and installation instructions.
7. Perform the steps outlined in the download and installation instructions on the download page.

Related Information

[Intel FPGA website](#)

3.2. Installing the Intel FPGA SDK for OpenCL

Unpack the downloaded tar file and run the installation files to install all the software and files.

Install the Linux version of the Intel FPGA SDK for OpenCL Standard Edition in a directory that you own.

- You must have `sudo` or `root` privileges.
- You must install the Linux OS kernel source and headers (for example, `kernel-devel.x86_64` and `kernel-headers.x86_64`), and the GNU Compiler Collection (GCC) (`gcc.x86_64`).
- If you are installing a package that includes Intel Code Builder, you must have Java SE 1.8.71 or later installed to run Intel Code Builder. If you have an earlier version of Java SE installed, you can still complete the installation of Intel Code Builder. However, you must meet the Java version prerequisite to run Intel Code Builder.

Attention: If you install the software on a system that does not contain any C Shell Run Commands file (`.cshrc`) or Bash Run Commands file (`.bashrc`) in your directory, you must set the environment variables `INTELFPGAOCCLSDKROOT` and `PATH` manually. Alternatively, you may create the `.cshrc` and `.bashrc` files, and then append the environment variables to them. To ensure that the updates take effect, restart your terminal after you set the environment variables.

To install the Intel FPGA SDK for OpenCL, Intel Quartus Prime Standard Edition software, and device support files simultaneously, perform the following tasks:

1. Unpack the downloaded tar file into a temporary directory.
2. Run the `setup.sh` file to install the SDK with the Intel Quartus Prime Standard Edition software.
3. *Note:* The installer sets the environment variable `INTELFPGAOCCLSDKROOT` to point to the path of the software installation.

Verify that `INTELFPGAOCCLSDKROOT` points to the current version of the software. Open a shell and then type `echo $INTELFPGAOCCLSDKROOT` at the command prompt.

If the returned path does not point to the location of the Intel FPGA SDK for OpenCL installation, edit the `INTELFPGAOCCLSDKROOT` setting.

Related Information

[Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables](#) on page 26

3.3. Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables

You have the option to set the Intel FPGA SDK for OpenCL Standard Edition Linux user environment variables permanently or transiently. The environment variable settings describe the FPGA board and the host runtime to the software.

Attention: If you set the environment variables permanently, you apply the settings once during installation. If you set the environment variables transiently, you must apply the settings during installation and during every subsequent session you run.

Table 3. Intel FPGA SDK for OpenCL Linux User Environment Variable Settings

Environment Variable	Path to Include
<code>PATH</code>	<code>\$(INTELFPGAOCCLSDKROOT)/bin</code> where <code>INTELFPGAOCCLSDKROOT</code> points to the path of the software installation
<code>LD_LIBRARY_PATH</code>	<code>\$(INTELFPGAOCCLSDKROOT)/host/linux64/lib</code>

- To apply permanent environment variable settings, open a shell and then type the `export <variable_name>=<variable_setting>:$(variable_name)` command.

For example, the command `export PATH="$(INTELFPGAOCCLSDKROOT)/bin":$PATH` adds `$(INTELFPGAOCCLSDKROOT)/bin` to the list of `PATH` settings.

- To apply transient environment variable settings, open a bash-shell command-line terminal and run the `source $(INTELFPGAOCCLSDKROOT)/init_opencl.sh` command. This command does not work in other shells.

Example script output:

```
Adding $(INTELFPGAOCCLSDKROOT)/bin to PATH
Adding $(INTELFPGAOCCLSDKROOT)/host/linux64/lib to LD_LIBRARY_PATH
```

where `AOCL_BOARD_PACKAGE_ROOT` points to the path of the Custom or Reference Platform.

3.4. Verifying Software Installation

Invoke the `version` utility command and verify that the correct version of the OpenCL software is installed.

- At a command prompt, invoke the `aocl version` utility command. An output similar to the one below notifies you of a successful installation:

```
aocl <version>.<build> (Intel(R) FPGA SDK for OpenCL(TM), Version <version>
Build <build>, Copyright (C) <year> Intel Corporation)
```

- If installation was unsuccessful, reinstall the software. You can also refer to the *Intel FPGA Software Installation and Licensing* manual and the Intel FPGA Knowledge Base for more information.

Related Information

- [Intel FPGA Software Installation and Licensing](#)
- [Intel FPGA Knowledge Base](#)

3.5. Installing an FPGA Board

Before creating an OpenCL application for an FPGA board on Linux, you must first download and install the Custom Platform from your board vendor. Most Custom Platform installers require administrator privileges. To install your board into a Linux host system, invoke the `install` utility command.

The steps below outline the board installation procedure. Some Custom Platforms require additional installation tasks. Consult your board vendor's documentation for further information on board installation.

1. Follow your board vendor's instructions to connect the FPGA board to your system.
2. Download the Custom Platform for your FPGA board from your board vendor's website. To download an Intel FPGA SDK for OpenCL Reference Platform, refer to the Intel FPGA SDK for OpenCL FPGA Platforms page.
3. Install the Custom Platform in a directory that you own (that is, not a system directory).

You can install multiple Custom Platforms simultaneously on the same system. To use the RTE utilities, such as `aocl diagnose` with multiple Custom Platforms. The Custom Platform subdirectory contains the `board_env.xml` file.

In a system with multiple Custom Platforms, ensure that the host program uses the FPGA Client Drivers (FCD) to discover the boards rather than linking to the Custom Platforms' memory-mapped device (MMD) libraries directly. If FCD is correctly set up for Custom Platform, FCD finds all the installed boards at runtime.

4. Set the `QUARTUS_ROOTDIR_OVERRIDE` user environment variable to point to the Intel Quartus Prime Standard Edition software installation directory. Open a shell and then type `echo $QUARTUS_ROOTDIR_OVERRIDE` at the command prompt.
5. Add the paths to the Custom Platform libraries (for example, memory-mapped (MMD) library) to the `LD_LIBRARY_PATH` environment variable setting.

For information on setting Linux user environment variables and running the `init_opencl` script, refer to the *Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables* section.

6. *Remember:* You need `sudo` or `root` privileges to install a board.

Invoke the command `aocl install <path_to_customplatform>` at a command prompt.

Invoking `aocl install <path_to_customplatform>` also installs a board driver that allows communication between host applications and hardware kernel programs.

7. To query a list of FPGA devices installed in your machine, invoke the `aocl diagnose` command.

The software generates an output that includes the `<device_name>`, which is an `acl` number that ranges from `acl0` to `acl31`.

Attention: For more information on querying the `<device_name>` of your accelerator board, refer to the *Querying the Device Name of Your FPGA Board* section.

8. To verify the successful installation of the FPGA board, invoke the command `aocl diagnose <device_name>` to run any board vendor-recommended diagnostic test.

Related Information

- [Querying the Device Name of Your FPGA Board](#) on page 32
- [Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables](#) on page 26
- [Installing the Cyclone V SoC Development Kit](#)
- [Intel FPGA SDK for OpenCL FPGA Platforms](#)

3.6. Verifying Host Runtime Functionality via Emulation

Test the functionality of the host runtime by emulating an OpenCL design example using the Intel FPGA SDK for OpenCL Standard Edition Emulator.

1. Install a Custom or Reference Platform because emulation targets a specific FPGA board.
2. Verify that the `QUARTUS_ROOTDIR_OVERRIDE` environment variable points to the Intel Quartus Prime Standard Edition software. Open a shell and then type `echo $QUARTUS_ROOTDIR_OVERRIDE` at the command prompt.
If the path to the installation directory of the Intel Quartus Prime Standard Edition software is not returned, add it to the `QUARTUS_ROOTDIR_OVERRIDE` setting.
3. Verify that the `LD_LIBRARY_PATH` environment variable setting includes the paths identified in *Setting the Intel FPGA SDK for OpenCL Standard Edition User Environment Variables*. Open a shell and then type `echo $LD_LIBRARY_PATH` at the command prompt.

If the returned path do not include `$INTELFPGAOCCLSDKROOT/host/linux64/lib`, add it to the `LD_LIBRARY_PATH` setting.

Each invocation of the emulated kernel creates a shared library copy called `<process_ID>-libkernel.so` in a default temporary directory, where `<process_ID>` is a unique numerical value assigned to each emulation run. You may override the default directory by setting the `TMPDIR` environment variable.

[Downloading an OpenCL Design Example](#) on page 28

[Compiling a Kernel for Emulation](#) on page 29

[Building the Host Application](#) on page 29

[Emulating Your OpenCL Kernel](#) on page 29

3.6.1. Downloading an OpenCL Design Example

The OpenCL Design Examples page contains sample applications of varying complexities that you can download and run on your FPGA.

The following instructions are for downloading the Hello World design.

1. In the OpenCL Design Examples page, under Basic Examples, click **Hello World**.
2. In the Hello World Design Example page, under Downloads, click **<version> x64 Linux package (.tgz)** to download the compressed file for your platform.
3. Unpack the .tgz file and save it in a directory to which you have write access.
Important: Ensure that the directory name does not contain spaces.

Related Information

[OpenCL Design Examples](#)

3.6.2. Compiling a Kernel for Emulation

To compile an OpenCL kernel for emulation, include the `-march=emulator` option in your `aoc` command.

- To compile the kernel for your target FPGA board, at a command prompt, navigate to the `hello_world` design and then invoke the following command:

```
aoc -march=emulator -v -board=<board_name> device/  
hello_world.cl -o=bin/hello_world_emulation.aocx
```

The Intel FPGA SDK for OpenCL Offline Compiler compiles the `hello_world.cl` kernel source file and creates the `hello_world_emulation.aocx` emulation-specific executable file in the `bin` subdirectory.

3.6.3. Building the Host Application

Build the host executable with the `<path_to_exm_openc1_hello_world_x64_linux_<version>>/hello_world/Makefile` file.

To build the host application, perform the following tasks:

1. Navigate to the `hello_world` directory.
2. Invoke the `$ make -f Makefile` command. Alternatively, you can simply invoke the `make` command.

The `hello_world` executable will be in the `<path_to_exm_openc1_hello_world_x64_linux_<version>>/hello_world/bin` directory.

3.6.4. Emulating Your OpenCL Kernel

To emulate your OpenCL kernel, run the emulation `.aocx` file on the platform on which you build your kernel.

To emulate your kernel, perform the following steps:

1. Run the utility command `aocl linkflags` to find out which libraries are necessary for building a host application. The software lists the libraries for both emulation and regular kernel compilation flows.
2. Link your host application to the libraries returned by the `aocl linkflags` utility command.
3. Move the `hello_world_emulation.aocx` file to the current working directory so that the host can locate it easily.
4. To run the host application for emulation, invoke the `env CL_CONTEXT_EMULATOR_DEVICE_INTELFPGA=<number_of_devices> <host_application_filename>` command. This command specifies the number of identical emulation devices that the Emulator needs to provide.

Each invocation of the emulated kernel creates a shared library copy called `<process_ID>-libkernel.so` in a default temporary directory, where `<process_ID>` is a unique numerical value assigned to each emulation run. You may override the default directory by setting the `TMPDIR` environment variable.

Related Information

[Running the Host Application](#) on page 34

3.7. Creating the FPGA Hardware Configuration File of an OpenCL Kernel

Download the Linux version of the `hello_world` OpenCL design example from the OpenCL Design Examples page. Compile the `hello_world` kernel program using the Intel FPGA SDK for OpenCL Offline Compiler to create the `hello_world.aocx` executable file. The `.aocx` file is the FPGA hardware configuration file.

After you successfully install your FPGA board and emulate your kernel, you can create a `.aocx` file that executes on the device. The steps below describe the process of creating a `.aocx` file from the `hello_world` example design. For more information on the OpenCL design examples, refer to the OpenCL Design Examples page.

Note:

The Intel FPGA SDK for OpenCL Offline Compiler compiles an OpenCL kernel for a target FPGA board. You must install the FPGA board before creating a hardware configuration file. If you have not installed the FPGA board, refer to *Installing an FPGA Board* for more instructions.

1. Verify that the `QUARTUS_ROOTDIR_OVERRIDE` environment variable points to your Intel Quartus Prime software. Open a shell and then type `echo $QUARTUS_ROOTDIR_OVERRIDE` at the command prompt.

If the path to the installation directory of the Intel Quartus Prime Standard Edition software is not returned, add it to the `QUARTUS_ROOTDIR_OVERRIDE` setting.

2. Select your target FPGA board. To list the FPGA boards available in your Custom Platform, invoke the command `aoc -list-boards` at a command prompt.

For more information on the `-list-boards` option of the `aoc` command, refer to the *Listing the Available FPGA Boards in Your Custom Platform (-list-boards)* section of the *Intel FPGA SDK for OpenCL Standard Edition Programming Guide*.

3. At a command prompt, navigate to the `hello_world` design directory containing the `hello_world.cl` file that you used for emulation.
4. To compile the kernel for your target FPGA board, invoke the following command:

```
aoc -v -board=<board_name> device/hello_world.cl -o=bin/  
hello_world.aocx
```

This command performs the following tasks:

- Generates the Intel Quartus Prime design project files from the OpenCL source code.
- Checks for initial syntax errors.
- Performs basic optimizations.
- Creates a `hello_world` directory containing necessary intermediate files.
- Creates the *Intel FPGA SDK for OpenCL Offline Compiler Object File* (`.aoco`).
- Creates the `.aocx` file.

Attention: The `.aocx` file might take hours to build, depending on the complexity of the kernel. To view the progress of the compilation on-screen, include the `-v` flag in your `aoc` command. An example output is shown below.

```
aoc: Environment checks are completed successfully.  
You are now compiling the full flow!!  
aoc: Selected target board <board_name>  
aoc: Running OpenCL parser...  
aoc: OpenCL parser completed successfully.  
aoc: Compiling...  
aoc: Linking with IP library ...  
aoc: First stage compilation completed successfully.  
aoc: Setting up project for CvP revision flow...  
aoc: Hardware generation completed successfully.
```

The offline compiler displays the line `aoc: Hardware generation completed successfully.` to signify the completion of the compilation process.

For more information about the `-board=<board_name>` option of the `aoc` command, refer to the *Compiling a Kernel for a Specific FPGA Board (-board=<board_name>)* section of the *Intel FPGA SDK for OpenCL Standard Edition Programming Guide*.

For more information about the `-v` option of the `aoc` command, refer to the *Generating Compilation Progress Report (-v)* section of the *Intel FPGA SDK for OpenCL Standard Edition Programming Guide*.

For more information about the `-o <filename>` option of the `aoc` command, refer to the *Specifying the Name of an Intel FPGA SDK for OpenCL Offline Compiler Output File (-o=<filename>)* section of the *Intel FPGA SDK for OpenCL Standard Edition Programming Guide*.

3.8. Updating the Hardware Image on the FPGA

If applicable, before you execute an OpenCL kernel program on the FPGA, ensure that the flash memory of the FPGA contains a hardware image created using a current version of the OpenCL software.

- Remember:**
- If your Custom Platform requires that you preload a valid OpenCL image into the flash memory, for every major release of the Intel Quartus Prime Design Suite, program the flash memory of the FPGA with a hardware image compatible with the current version of the software.

3.8.1. Querying the Device Name of Your FPGA Board

Some OpenCL software utility commands require you to specify the device name (<device_name>). The <device_name> refers to the acl number (e.g. acl0 to acl31) that corresponds to the FPGA device. When you query a list of accelerator boards, the OpenCL software produces a list of installed devices on your machine in the order of their device names.

- To query a list of installed devices on your machine, type `aocl diagnose` at a command prompt. The software generates an output that resembles the example shown below:

```
aocl diagnose: Running diagnostic from INTELFPGAOCSDKROOT/board/
<board_name>/<platform>/libexec

Verified that the kernel mode driver is installed on the host machine.

Using board package from vendor: <board_vendor_name>
Querying information for all supported devices that are installed on the
host machine ...

device_name  Status  Information
-----
acl0         Passed  <descriptive_board_name>
           PCIe dev_id = <device_ID>, bus:slot.func = 02:00.00,
           at Gen 2 with 8 lanes.
           FPGA temperature = 43.0 degrees C.

acl1         Passed  <descriptive_board_name>
           PCIe dev_id = <device_ID>, bus:slot.func = 03:00.00,
           at Gen 2 with 8 lanes.
           FPGA temperature = 35.0 degrees C.

Found 2 active device(s) installed on the host machine, to perform a full
```

```
diagnostic on a specific device, please run aocl diagnose <device_name>  
DIAGNOSTIC_PASSED
```

3.8.2. Programming the Flash Memory of an FPGA

Configure the FPGA by loading the hardware image of an Intel FPGA SDK for OpenCL design example into the flash memory of the device. When there is no power, the FPGA retains the hardware configuration file in the flash memory. When you power up the system, it configures the FPGA circuitry based on this hardware image in the flash memory. Therefore, it is imperative that an OpenCL-compatible hardware configuration file is loaded into the flash memory of your FPGA.

Preloading an OpenCL image into the flash memory is necessary for the proper functioning of many Custom Platforms. For example, most PCIe-based boards require a valid OpenCL image in flash memory so that hardware on the board can use the image to configure the FPGA device when the host system powers up for the first time. If the FPGA is not configured with a valid OpenCL image, the system will fail to enumerate the PCIe endpoint, or the driver will not function.

Before running any designs, ensure that the flash memory of your board has a valid OpenCL image that is compatible with the current OpenCL software version. Consult your board vendor's documentation for board-specific requirements.

Caution: When you load the hardware configuration file into the flash memory of the FPGA, maintain system power for the entire loading process, which might take a few minutes. Also, do not launch any host code that calls OpenCL kernels or might otherwise communicate with the FPGA board.

To load your hardware configuration file into the flash memory of your FPGA board, perform the following tasks:

1. Install any drivers or utilities that your Custom Platform requires.
2. Download a design example for your Custom Platform.

Remember: Download design examples from the OpenCL Design Examples page, and extract the example to a location to which you have write access. Ensure that the location name does not contain spaces.

3. To load the hardware configuration file into the flash memory, invoke the `aocl flash <device_name> <design_example_filename>.aocx` command, where `<device_name>` refers to the acl number (e.g. `acl0` to `acl31`) that corresponds to your FPGA device, and `<design_example_filename>.aocx` is the hardware configuration file you create from the `<design_example_filename>.cl` file in the example design package.
4. Power down your device or computer and then power it up again.

Power cycling ensures that the FPGA configuration device retrieves the hardware configuration file from the flash memory and configures it into the FPGA.

Warning: Some Custom Platforms require you to power cycle the entire host system after programming the flash memory. For example, PCIe-based Custom Platforms might require a host system restart to reenumerate the PCIe endpoint. Intel recommends that you power cycle the complete host system after programming the flash memory.

3.9. Executing an OpenCL Kernel on an FPGA

You must build your OpenCL host application with the Makefile file, and run the application by invoking the `hello_world` executable. You need GNU development tools such as `gcc` and `make` to build the OpenCL application.

Related Information

[Building the Host Application](#) on page 29

3.9.1. Running the Host Application

To execute the OpenCL kernel on the FPGA, run the Linux host application that you built from the Makefile.

1. Add the path `$INTELFPGAOCCLSDKROOT/host/linux64/lib` to the `LD_LIBRARY_PATH` environment variable.
2. At a command prompt, navigate to the host executable within the `<path_to_exm_opencl_hello_world_x64_linux_<version>>/hello_world/bin` directory.
3. Invoke the `hello_world` executable.
The `hello_world` executable executes the kernel code on the FPGA.

3.9.2. Output from Successful Kernel Execution

When you run the host application to execute your OpenCL kernel on the target FPGA, the OpenCL software notifies you of a successful kernel execution.

Example output:

```
Reprogramming device [0] with handle 1
Querying platform for info:
=====
CL_PLATFORM_NAME           = Intel(R) FPGA SDK for OpenCL(TM)

Kernel initialization is complete.
Launching the kernel...

Thread #2: Hello from the Intel(R) FPGA OpenCL(TM) compiler!

Kernel execution is complete.
```

3.10. Uninstalling the Software

To uninstall the Intel FPGA SDK for OpenCL Standard Edition for Linux, remove the software package via the GUI uninstaller, then delete the software directory and restore all modified environment variables to their previous settings.

1. Remove the software package by performing one of the following tasks:
 - a. To uninstall the SDK, run the `aocl-<version>-uninstall.run` program located in the `<install directory>/uninstall` directory of the Intel Quartus Prime Standard Edition software.
2. Remove `$INTELFPGAOCCLSDKROOT/bin` from the `PATH` environment variable.
3. Remove `$INTELFPGAOCCLSDKROOT/host/linux64/lib` from the `LD_LIBRARY_PATH` environment variable.
4. Remove the `INTELFPGAOCCLSDKROOT` environment variable.
5. Remove the `QUARTUS_ROOTDIR_OVERRIDE` environment variable.

3.11. Uninstalling the FPGA Board

To uninstall an FPGA board for Linux, invoke the `uninstall` utility command, uninstall the Custom Platform, and unset the relevant environment variables. You must uninstall the existing FPGA board if you migrate your OpenCL application to another FPGA board that belongs to a different Custom Platform.

To uninstall your FPGA board, perform the following tasks:

1. Disconnect the board from your machine by following the instructions provided by your board vendor.
2. Invoke the `aocl uninstall <path_to_customplatform>` utility command to remove the current host computer drivers (for example, PCIe drivers). The Intel FPGA SDK for OpenCL uses these drivers to communicate with the FPGA board.
3. Uninstall the Custom Platform.
4. Unset the `LD_LIBRARY_PATH` environment variable.

A. Document Revision History for Intel FPGA SDK for OpenCL Standard Edition Getting Started Guide

Document Version	Intel Quartus Prime Version	Changes
2018.09.24	18.1	<ul style="list-style-type: none"> Replaced altera.com links with intel.com links. For example, http://dl.altera.com/opencl/ is now http://fpgasoftware.intel.com/opencl/.
